Brahmi Abbes

Junior Backend Developer | PHP & Laravel

Algeria | aa.brahmi@ensta.edu.dz | +213 551 376 996 | GitHub | LinkedIn

PROFESSIONAL SUMMARY

Junior backend developer specializing in PHP and Laravel, with hands-on experience designing relational data models, role-based access control, and real-time backend systems using Redis and WebSocket broadcasting (Laravel Reverb). Built and shipped three independent Laravel applications end-to-end, covering business logic, automated testing (Pest), and basic Docker containerization.

TECHNICAL SKILLS

Languages: PHP, JavaScript, SQL

Backend: Laravel, Eloquent ORM, Middleware, Laravel Reverb & Echo (WebSocket broadcasting), Queues & Jobs

Database & Caching: MySQL, Relational Data Modeling, Redis

Auth & Authorization: Role-Based Access Control, Spatie Laravel Permission

Testing: Pest

Tools: Git, GitHub, Filament, Docker (basic)

PROJECTS

Pharmacera — Pharmacy Management System | *Laravel*, *PHP*, *Eloquent*, *MySQL*, *Filament*, *Docker* | *Private repository*

- Designed role-based access control (Admin/Pharmacist/Cashier) with Spatie Laravel Permission to enforce operation-level permissions.
- Modeled batch-level inventory with FIFO sale allocation and expiry tracking, using row-level locking (BatchObserver) to prevent overselling under concurrent sales.
- Built the barcode-scan-to-sale workflow end-to-end, including stock-deduction logic and automated low-stock/out-of-stock email alerts.
- Implemented a full audit-trail activity log and PDF report generation (barryvdh/laravel-dompdf).
- Tested core business logic with Pest; containerized with Docker and deployed to a live environment (Render, with OPcache enabled).

SketchRush — Real-Time Drawing & Guessing Game | *Laravel*, *Laravel Reverb*, *Redis*, *MySQL*, *Docker* | GitHub

- Built the backend for a real-time multiplayer game using Laravel Reverb and Echo for WebSocket broadcasting, with Redis handling player presence and live game state.
- Implemented a server-authoritative round timer using Laravel's delayed queued jobs on a Redis queue connection, so rounds end consistently regardless of client state.
- Designed the scoring system with streak multipliers and a clue system enforcing a whole-game clue budget per player, separated from per-round letter-reveal limits — including diagnosing and fixing a bug where the two were conflated.
- Built the full game state machine (lobby, turn rotation, drawing, guessing, round end, game over) and a game-over leaderboard view.
- Wrote a Pest test suite covering scoring, hint reveals, turn advancement, guessing, and room creation.
- Used Docker to containerize the app for local development, and added server-side validation on room creation/join endpoints.

DevDZ — Community Platform for Algerian Developers | *Laravel 11*, *PHP*, *MySQL*, *Blade* | GitHub

- Built custom authentication and session handling with CSRF protection and custom middleware, and modeled relational data (users, posts, comments, votes, tags) to support voting, commenting, and search.
- Resolved a database constraint issue on the vote table and fixed PHP version mismatches blocking deployment; deployed on Railway.

EXPERIENCE

IT Department Intern — Sonatrach (TRC / GEM Gazoduc) | *April 2026*

- Observed enterprise IT operations and infrastructure workflows during a one-week placement.

EDUCATION

Bachelor in AI Engineering (in progress) — École Nationale Supérieure des Technologies Avancées (ENSTA), Algiers

LANGUAGES

Arabic — Native | English — Professional working proficiency
